APPLIED GLOBAL TECHNOLOGIES

When AGT needed to find a way to bring large amounts of power out into the field they found ATC. AGT had a very specific, complex design to fully provide the resources they needed to power their equipment out on the worksite. The trailer would need to support the weight, handle the control panels, and have the proper wiring to fully use the power that they were able to produce. After the design was complete, they were able to fit two 20kw generators with proper ventilation and gas supplies into the trailer. The complex installation work needed for these large generators and state of the art communications equipment was a new challenge for both companies but together we were able to provide them with the best solution to fit their need.

Nabors Well Services has been servicing oil and gas wells since 1948. When they came to ATC they had some success with steel trailers, but were looking for a lighter weight yet very rugged design. Their idea involved a multipurpose trailer that would serve as a break room, changing room, and office area that could be used regardless of where the job location was. The trailers featured a raised design for extra clearance and outfitted with generators to provide power in even the most remote regions.

Since that time, they have also designed a locker trailer as well as a tool trailer that replaced a truck design that they had been using previously. The ruggedness and durability of the ATC trailers has kept them coming back for more of their mobile solutions.

NABORS WELL SERVICES

The command centers are highly customizable and designed specifically for each organization's needs.

FERRARA FIRE APPARATUS

UNIVERSITY OF PITTSBURGH MEDICAL CENTER

The University of Pittsburgh medical center serves the health needs of more than 4 million people per year. The trailer serves two functions; it is a mobile training facility, but also handles live patients at events or in case of emergency. Working with live simulators, medical equipment, and a training room designed to reflect an emergency room gives the students a very realistic experience. Installed cameras record every move a trainee makes and can be reviewed later by students and teachers to improve skills and techniques. The trailer is packed full of the latest technology from the simulators down to live oxygen and air supplies throughout the trailer. The multi-function design of this trailer enables UPMC to fully utilize the technology that is installed and gives much more value for their investment.

LIFT GATE TRAILER

ATC is the leader in the trailer industry when it comes to customization, quality and customer service. ATC has worked with many companies to provide unique solutions to their extremely specific needs. With a strong team of sales that works with you throughout the entire process, an engineering team who uses state of the art equipment and a workforce that has a quality unmatched, you can be sure that you will receive exactly the trailer you desire.

Just a few of the needs we have met:

- * *U.S. Coast Guard equipment storage units*
- * *U.S. Navy submarine testing trailers*
- * *Automated salmon tagging units*
- * *Mobile wine bottling units*
- * *Oil rigging mobile offices*
- * *Emergency response units*
- * *Mobile bunk houses*
- * *Mobile communication centers*
